Executive Summary
The intent of this plan is to provide guidance to City staff in dealing with coyotes in Santa Ana. Guidelines and provisions of this plan do not supersede federal, state, county, or local regulations and policies.

Management Strategy
The City’s strategy for managing coyotes is based on balancing respect and protection for wildlife and their habitats without compromising public safety. The strategy is comprised of the following three-pronged approach:

1) Public education designed around co-existence with coyotes.
2) Enforcement of laws and regulations prohibiting the feeding of wildlife.
3) Ensuring public safety by implementing appropriate tiered responses to coyote and human interactions. This plan requires active participation by community members, including residents, homeowners associations, volunteers, and City personnel.

Education
Education is the key to ensuring residents make appropriate decisions regarding their safety and managing their property and pets. Education involves providing written materials and brochures that are made available at City facilities. Educational tools include signage warning pet owners of the presence of coyotes. The goal of education is to decrease attractants, increase pet safety, reshape coyote behavior through hazing, and creating reasonable expectations of normal coyote behavior.

The National Parks Service in Los Angeles is conducting research that has revealed that all coyotes do not travel from open spaces into urban areas. Instead, they are discovering that the urban coyotes may always live within the urban setting and adjust their behavior around the urban activities.

Enforcement
The act of feeding wildlife leads to an increase in wildlife activity. Feeding can attract coyotes and their prey increasing the likelihood of creating a habituated coyote(s) that results in increases in coyote and human interactions.

California law prohibits feeding wildlife. Santa Ana Animal Services Officers will strictly enforce the State law(s) pertaining to this activity.

CALIFORNIA CODE OF REGULATIONS TITLE 14 §251.1. Harassment of Animals states, “Except as otherwise authorized in these regulations or in the Fish & Game Code, no person shall harass, herd or drive any game or nongame bird or mammal or furbearing mammal. For the purposes of this section, harass is defined as an intentional act which disrupts an animal's normal behavior patterns, which includes, but is not limited to, breeding, feeding or sheltering.

Coyote sightings or incidents can be reported by calling (714) 245-8792.
Response Plan
A detailed tiered response plan has been developed to provide a mechanism for identifying and classifying different levels of human and coyote interactions. Definitions of coyote encounters are listed in Appendix A. Appendix B provides a chart detailing coyote behavior, behavior classification and recommended responses.

Coyote Management Plan
Background
The City of Santa Ana (“Santa Ana”) does not own or have any control over wild animals found within its boundaries nor is Santa Ana responsible for the actions or damage caused by them.

Santa Ana Animal Services Officers do not typically respond to calls for service of sightings of coyotes. However, they will respond to calls involving a sick or injured coyote(s) or if there is a public safety issue (coyote(s) threatening people or coyote(s) in an area frequented by people, such as a yard, park, playground, school).

Difficulties Managing Wildlife
Although Santa Ana places a high value on its wildlife, some individual animals that have adapted to urban environments have the potential to cause problems. The City’s policies include prevention and implementation of remedial measures that do not harm the wildlife or their habitats.

A wildlife problem is defined as situations that causes a health or safety issue to residents. In cases where problems with wildlife are associated with human behavior (leaving garbage exposed or intentional feeding of wildlife), ordinances and enforcement may be enacted to minimize conflict.

In some cases, traditional management tools are ineffective. For example, relocation of animals is not ecologically sound and is prohibited in California without permission from the California Department of Fish and Wildlife (CDFW). Generally, relocated animals do not survive transfer. If they do, they rarely stay in the relocation area and tend to disperse to other locations where they may cause problems to humans, become involved in territorial disputes, or introduce disease. In some instances, the translocated coyote will go to great lengths to return to its previous territory. For these reasons, the CDFW rarely allows relocation of wildlife.

As a last resort, lethal control measures, when employed, are controversial and non-selective, meaning they target the alpha coyote or problem coyote. If they are used, they must be humane and in compliance with federal and state laws.

It is not economically or ecologically sound to remove coyotes from the urban ecosystem. Attempts made by local, state and federal agencies or private organizations to eradicate coyotes have proven ineffective.
What Role do Coyotes Play in the Environment?
Coyotes play an important role in the urban ecosystem, particularly as a top-predator. They eat a broad range of small animals (squirrels, mice, rabbits, rats and gophers). Coyotes control the population of these animals, many of which are considered pests to humans. Coyotes also prey on “mesopredators,” such as raccoons and opossums. Without a top predator like the coyote, mesopredators can dramatically reduce bird populations by eating their eggs (Crooks and Soule, 1999). Coyotes also disperse seeds of native plant species and recycle nutrients.

How do Humans Perceive Coyotes?
People respond to coyotes in various ways. Personal experiences with coyotes influence perceptions and experiences range from animal sightings without incident to stalking, killing of pets or, at the extreme, an attack on a person. Coyote attacks on humans are very infrequent. Although such incidents generate significant media coverage, they remain a very rare event.

Because wild animals conjure up fear in some people, actual sightings and perceptions may become exaggerated or misconstrued (see Appendix A for coyote description encounters). The wide range in perceptions of urban coyotes from Santa Ana residents supports the need for strong and consistent educational messages to clarify management techniques.

Have Coyote Numbers Increased in Santa Ana?
Without tracking and updated inventories, it is difficult to determine if the number of coyotes has increased. What is known is that coyotes can become habituated to humans if they are intentionally or unintentionally fed, which can lead to loss of fear of people and bolder behavior.

In general, coyotes regularly roam an area of about two to five square miles to obtain enough food for the pack members. Normally, each pack is a territorial family group made up of three to ten individuals. A portion of the area the pack inhabits is the pack’s territory, which they will defend from other coyotes.

A coyote pack usually has only one breeding (or alpha) female. This female often produces more pups than can be supported by the pack. Young coyotes may leave the pack but dispersal patterns are highly variable. Juvenile coyotes or older coyotes often become transients.

Transients move in narrow undefended zones between pack territories searching for an open habitat to occupy or group to join. It is largely because of the constant influx of transients that coyote eradication programs fail.
Monitoring and Collecting Data
Monitoring and data collection are critical components of an effective coyote management plan. This is best accomplished with input from both residents and city officials.

The purpose of monitoring human-coyote interactions is to document where coyotes are frequently seen and to identify human-coyote conflict hotspots if they exist. Gathering specific data on incidents will allow for targeting of educational campaigns and conflict mitigation efforts, as well as the ability to measure success in reducing conflicts over time.

Public Education and Outreach
Education is the key to having residents make appropriate decisions regarding their safety or managing their property and pets. This involves decreasing attractants, increasing pet safety and creating reasonable expectations of normal coyote behavior.

Learning how to respond to a coyote encounter empowers residents and can help reduce undesired coyote behaviors. It is important to understand normal coyote behavior. For example, vocalization is normal acceptable behavior.

Education and outreach efforts by the city should focus on:

- Understanding human safety, pet safety, coyote attractants, deterrents to coyotes on private property, including appropriate fencing, exclusion techniques, “what to do” tips, and information on appropriate hazing techniques.
- Developing a common language and awareness of normal versus abnormal behavior when discussing encounters with coyotes (see definitions in Appendix A)
- Disseminating information to residents, businesses and schools through the City’s website, social media, traditional media, fliers/handouts, mailers, etc.
- Consulting with land managers, non-profit organizations like the Humane Society of the United States and agencies like the California Department of Fish and Wildlife that provide public education materials, programs and expertise.

Coyote Attractants in Urban Areas
Coyotes are drawn to urban and suburban areas for the following reasons:

1. **Food.** Urban areas often support large numbers of rodents. However, coyotes can be attracted into suburban neighborhoods by human-associated food (pet food, unsecured compost or trash and fallen fruit in yards). Intentional and unintentional feeding can lead coyotes to associate humans with sources of food, resulting in negative interactions among coyotes, people and pets. To reduce food attractants in urban and suburban areas:
   - Never hand-feed or otherwise deliberately feed a coyote.
   - Avoid feeding pets outside. Remove sources of pet food and water that a coyote could easily obtain. If feeding pets outside is necessary, remove the
bowl and any leftover food promptly.

- Never include meat or dairy in compost.
- Maintain good housekeeping, such as regularly raking areas around bird feeders.
- Remove fallen fruit from the ground.
- Only place trashcans curbside the morning of collection. If you leave them out overnight, trashcans are more likely to be tipped over and explored.
- Bag especially attractive food wastes, such as meat scraps or leftover pet food, before discarding.

2. **Water.** Urban areas provide a year-round supply of water that supports coyotes and their prey.

- During drought or otherwise dry conditions, water can be as alluring as food, so remove water bowls set outside for pets and make watering cans unavailable.

3. **Access to shelter.** Parks, greenbelts, open spaces, golf courses, buildings, sheds, decks and crawl spaces, etc., increase the amount and variability of cover for coyotes. They allow coyotes to safely and easily remain close to people, pets, homes and businesses without detection.

- In the spring, coyotes concentrate their activities around dens or burrows in which their young are sheltered. Coyotes may take advantage of available spaces under sheds or decks for use as a den, bringing them into close contact with people and pets.

4. **Unattended Pets.** Pets are a normal part of an urban landscape. Coyotes may consider pets as potential prey or competitors.

- **Free-roaming pets.** Cats and small dogs may attract coyotes into neighborhoods. The best way to minimize risk to pets is to not leave them outside unattended.
- **Cats.** Coyotes primarily eat small mammals such as mice and rats, but will also prey on slightly larger mammals such as rabbits and groundhogs. Attacks on cats are normal coyote behavior. The best way to protect cats from coyotes is to keep cats primarily indoors and only let them outside in a secure enclosure or when accompanied by a person and under the control of a leash and harness.
- **Feral cats.** People who feed feral cats are often concerned about coyotes. Coyotes can be attracted to the outdoor pet food. The following tips are helpful:
  - Do not feed feral cats.
  - Provide escape routes for cats.
  - Haze coyotes seen on the property (see Appendix C).
- **Dogs.** Dogs are also vulnerable to coyote confrontations. These incidents generally involve coyotes who are accustomed or habituated to people (usually from feeding), or coyotes who are protecting their territory and pups (usually during breeding season).
  - Small, unattended dogs may be seen as potential prey. It is
important to keep dogs on a six-foot long or shorter leash when outdoors or to stay within six feet of them. Attacks on unattended, small dogs are normal coyote.

- Although attacks on larger dogs are rare, coyotes may attempt to attack a large dog when they feel their territory is threatened. This generally occurs during coyote breeding season (January through March). During this time, it is important not to let dogs outside unattended and to keep them on leashes (six feet long or less).
- Do not allow dogs off leash, off your property. It is against the law and unsafe for your dog.

- **Other Pets.** Other domestic animals kept outside, such as rabbits, may also be viewed as prey. Protect outdoor animals with protective fencing and/or confine them in sturdy cages each evening.

Residents are encouraged to use the Yard Audit Checklist (Appendix D) as a tool to help recognize and remove attractants in their yards and neighborhoods.

While human attacks are very rare, urban landscape development, habituation through intentional and unintentional feeding, pet related incidents and media attention have led some urban residents to fear coyotes. Steps must be taken to address safety concerns and misconceptions and appropriate responses to potential threats to human safety. It is important to keep in mind that coyotes have been in and around Santa Ana (and other parts of Southern California) for a very long time.

**Hazing and Behavioral Change**

Hazing or “fear conditioning” is the process that facilitates change in coyote behavior. The more often an animal is hazed, the more effective hazing is in changing coyote behavior (see Appendix C for coyote hazing overview).

Levels of hazing need to be appropriately relevant to coyote activity.

- **Coyotes live in open spaces.** The best practice is to leave them alone and educate the public on personal safety.
- **Coyotes are often out late at night when few people are present.** This is normal, acceptable behavior. Hazing may not be necessary.
- **Exceptions:** In early stages of hazing, programs should still engage the animal. Coyotes that associate danger in the presence of people under all circumstances will be reinforced to avoid contact.

Hazing must be more exaggerated, aggressive and consistent when first beginning a program of hazing. As coyotes “learn” appropriate responses to hazing, it will take less effort from hazers. Early in the process, it is extremely common for coyotes not to respond to hazing techniques. Without a history of hazing, they do not have the relevant context to respond in the desired outcome (to leave). Techniques and tools can be used...
in the same manner for one or multiple animals. Usually, there is a dominant animal in a group who will respond—others will follow its lead. DO NOT ignore, turn your back or avoid hazing because there are multiple animals instead of a single individual. The more often an individual coyote is hazed by a variety of tools and techniques and a variety of people, the more effective hazing will be in changing that animal’s future behavior. Hazing must be directly associated with the person involved in the hazing actions. The coyote must be aware of where the potential threat is coming from and identify the person. Coyotes can and do recognize individual people and animals in their territories. They can learn to avoid or harass specific individuals in response to behavior of the person and/or pet. Coyotes can be routine in habit. Identifying their normal habits can help target which habits to change. For example, the coyote patrols the same bike path at the same time in the morning three to five days a week. Hazers should concentrate on that time and place to encourage the animal to adapt its routine to decrease contact with people.

Certain levels of hazing must always be maintained so that future generations of coyotes do not learn or return to unacceptable habits related to habituation to people. Human behavior must change to support hazing and continued identification and, if necessary, remove possible attractants. Education about exclusion techniques including how to identify and remove attractants, personal responsibility in pet safety and having reasonable expectations are critical parts of a coyote hazing plan.

Coyotes are skittish by nature. Habituated behavior is learned and reinforced by human behavior. Coyotes as a rule DO NOT act aggressively toward aggressive people. The one exception is a sick or injured animal. Engaging a sick or injured animal can result in unpredictable behavior. If this is suspected, people should not engage. They should remove themselves from the situation and immediately contact the Santa Ana Animal Services Unit at (714) 245-8792.

Individuals involved in hazing need to be trained in explaining hazing to residents who witness the process. They also need to explain the difference between hazing and harassment of wildlife and goals of appropriate behavior for coexistence.

**Goals of Hazing**
The goals of hazing are to:

1) Reshape coyote behavior to avoid human contact in an urban setting.
2) Give residents tools to actively engage in reshaping coyote behavior.
3) Model appropriate and effective hazing behavior and share accurate information about coyotes with others.

**Hazing Process**
People living in close proximity to coyotes can remove coyote attractants, identify potentially dangerous situations for their pets and themselves, and respond in a manner designed to change coyote behavior.
Overview of Hazing
Hazing is a process whereby a person or a number of individuals encountering a coyote respond in like manner to make a coyote afraid and choose to leave a situation where their presence is unwanted.

Basic hazing consists of standing your ground, never ignoring or turning your back to a coyote, and yelling and/or making unpleasant and frightening noises until the animal chooses to leave. If the coyote does not leave, more aggressive tactics may be considered.

Aggressive hazing consists of approaching quickly and aggressively, throwing projectiles like stones near, but not at, the animal, spraying with a hose or water gun, or creating a more heightened fear of contact so the animal flees. For more options, see Appendix C on hazing.

Hazing must continue once it begins until the animal leaves. Otherwise, the coyote will learn to “wait” until the person gives up.

Hazing never involves injury to the animal, only the threat of injury. An injured animal becomes less predictable than a normal, healthy one.

A common concern with hazing involves potential danger to the hazer. Coyotes are unlikely to escalate a situation with a person who is aggressively hazing. It is important that the hazer provide the coyote a clear escape route to flee and not corner the animal. A cornered animal may attack the hazer.

Elements of an effective hazing campaign include:

1. Pet owners need to protect pets. Off-leash and unattended dogs and unattended outside cats attract coyotes (as does pet food).
2. Residents need to learn hazing effectiveness and techniques. A hazing program must be instituted, maintained and evaluated on a regular basis.
3. Hazing needs to be active for a sustained period of time to achieve the desired change in behavior.
4. Hazing requires monitoring to assess its effectiveness and to determine if further action or more aggressive hazing is needed.

Hazing Training Program
Because coexisting with wildlife involves the community, initiating the hazing training programs and hazing activities by volunteers must be supervised by experts. Without this support, the programs will ultimately fail. Information should include basic training on background, coyote ecology information, and an overview of hazing and examples of techniques. Materials should be provided such as handouts, contact information and resources when questions, comments and concerns come up relating to coyotes.
Volunteers need to learn about coyote behavior and be aware of realistic expectations, understanding normal versus abnormal coyote behavior and having a consistent response to residents’ concerns and comments.

**Public Hazing Training**

Hazing requires community involvement, understanding and support. Residents are best equipped to respond consistently and at the most opportune times in their own neighborhoods, parks and open spaces not identified as nature reserves.

1. Locations of trainings offered shall be based on where human-coyote conflicts are most often reported in specific neighborhoods, parks or open space or proactively when requested by neighborhood community or volunteer groups.
2. Trainings are free to the public.
3. Topics covered would include, but are not limited to:
   - basic coyote information, including natural history and ecology
   - the role of coyotes in ecosystems and their rights to exist
   - discussion on why coyotes are in the City
   - normal and abnormal coyote behavior
   - seasonal behavior changes: breeding season, pups, denning behavior
   - reality of dangers towards people vs. danger towards pets
   - children and coyotes
   - how human behavior influences coyote behavior
   - attractants
   - tips on deterring animals from entering private property
   - appropriate response when encountering a coyote
   - what is hazing: goals and how to engage
   - appropriate hazing techniques and tools
   - pet safety tips
4. Updates, additional coyote information, electronic flyers and handouts are to be distributed to participants. Information is encouraged to be passed on to others.
5. Participants shall be notified of “hot spots” and asked to haze in the area.
6. Ask for feedback on hazing training and use of hazing techniques.
7. Participants shall email detailed accounts of encounters and hazing (Hazing interaction reports) to volunteer hazers for evaluation of the program, progress, successful tools and techniques being used, and techniques and tools needed.
   a) Date, location, time of day, number of coyotes
   b) Initial coyote behavior, hazing behavior, coyote response
   c) Effectiveness ratings
   d) Tools and techniques used
   e) Additional details/comments
Creating a Volunteer Hazing Team
A group of volunteers trained in coyote hazing techniques can be quite useful to respond to coyote conflicts in public areas (such as parks, playgrounds, etc.). The following guidelines are suggested for managing a volunteer hazing team:

1. Volunteers should be trained in proper coyote hazing techniques (as discussed above).
2. Volunteers should be added to a Community Citizen Volunteer email list, from which they will be notified of “hot spots” and asked to haze in the area.
3. Updates, additional coyote information, electronic flyers and handouts should be sent to members of the Community Citizen Volunteer group to disseminate to the general public.
4. Volunteers should fill out a Hazing Interaction Report after each hazing activity.

Summary of Hazing
Hazing is a process whereby individuals and volunteers respond in like manner to make a coyote uncomfortable and choose to leave a situation where their presence is unwanted.

Basic hazing consists of standing your ground, never ignoring or turning your back to a coyote(s), yelling and making unpleasant and frightening noises until the animal(s) choose to leave.

Aggressive hazing consists of approaching quickly and aggressively, throwing projectiles near the animal, spraying with a hose or water gun containing water or white vinegar, or creating fear of contact so the animal leaves the situation. Note: Many projectiles are not legal, including but not limited to slingshots, paintballs, guns and pepper balls.

Hazing must continue once it begins until the animal leaves. Otherwise, the coyote will learn to “wait” until the person gives up. The coyote will then become less affected by hazing.

Hazing never involves injury to the animal. An injured animal becomes less predictable than a normal, healthy one who responds in a consistent and predictable manner to hazing.

Hazing should be conducted in a manner that allows the coyote to return to its normal habitat in a direction that minimizes harm to the animal. Hazing in the direction of other houses and busy streets should be avoided.

Hazing uses a variety of different hazing tools. This is critical as coyotes get used to individual items and sounds.

1. **Noisemaker**: voice, whistles, air horns, bells, “shaker” cans, pots, pie pans
2. **Projectiles**: sticks, small rocks, cans, tennis balls, rubber balls
3. **Deterrents**: hoses, spray bottles with vinegar, pepper spray, bear repellant, walking sticks
Threat Level Tiered Response

Level Green  *Behavior:* A coyote is seen or heard in an area. Sighting may be during the day or night. Coyote may be seen moving through the area.
*Response:* Education and possible hazing

Level Yellow  *Behavior:* A coyote appears to frequently associate with humans or human-related food sources and exhibits little wariness of human presence. Coyote is seen during the day resting or continuously moving through an area frequented by people.
*Response:* Education and possible aggressive hazing, volunteer hazing team created.

Level Orange  *Behavior:* A coyote is involved in an incident(s) where there is an attended domestic animal loss. Several level orange incidents in the same general area may indicate the presence of a habituated coyote(s).  *Response:* Education and aggressive hazing needed, volunteer hazing team created, and public awareness of incident(s) and circumstances discussed. If multiple level orange incidents have occurred in the same vicinity within a short amount of time, lethal removal may be considered.

Level Red:  *Behavior:* A coyote that has been involved in an investigated and documented, provoked or unprovoked close encounter or attack on humans. *Response:* City staff may take all necessary measures to ensure the public’s safety.
Appendix A - Definitions of Encounters with Coyotes

**Active Coexistence:** Humans and coyotes exist together. Humans take an active role in keeping coyotes wild by learning about coyote ecology and behavior, removing attractants, taking responsibility for pet safety, and hazing coyotes in neighborhood or community spaces (except for predetermined coyote-appropriate areas). Hazing is not appropriate in a designated nature reserve or similar open space, unless the coyote exhibits threatening behavior to persons or leashed pets.

**Attack** – A human is injured or killed by a coyote.

  - **Provoked** - A human-provoked attack or incident where the human involved encourages the coyote to engage. Examples include dog off-leash in an on-leash area; dog on leash longer than 6’ in length, or a human intentionally corners, injures, tries to injure, attempts to capture or feeds the coyote.

  - **Unprovoked** - An unprovoked attack or incident where the human involved does not encourage the coyote to engage.

**Encounter:** An unexpected, direct meeting between a human and a coyote that is without incident.

**Feeding**

  - **Intentional feeding** - When a person or persons actively and intentionally feeds coyotes or provides food for animals in the coyote food chain.

  - **Unintentional feeding** - When a person or persons are unintentionally providing access to food. Some examples are accessible compost, fallen fruit from trees, open sheds and doors, and pet food left outdoors.

  - **Unintentional feeding: bird feeders** – When a person, persons or business with bird feeders provides food for coyotes, e.g. birds, bird food, rodents, and squirrels. Bird feeders must be kept high enough from the ground so a coyote is unable to reach the feeding animals. The area under the bird feeder must be kept clean and free of residual bird food.

**Hazing:** A training method that employs immediate use of deterrents to move an animal out of an area or discourage an undesirable behavior or activity. Hazing techniques include loud noises, spraying water, bright lights, throwing objects near but not at the animal and shouting. Hazing can help maintain a coyote’s fear of humans and deter them from neighborhood spaces, such as backyards and play spaces. Hazing does not and should not damage animals, humans or property.

**Observation:** The act of noticing or taking note of tracks, scat or vocalizations.
Pet Attack

**Attended animal loss or injury** - When a person is within 6’ of the pet and the pet is on leash and is attacked and injured or killed by a coyote.

**Domestic animal loss or injury** - A coyote injures or kills a pet. Also includes “depredation”—predation on domestic pets. Unattended animal loss or injury is considered the result of normal coyote behavior.

**Suspected Pet Attack:** A coyote is an opportunistic feeder and may feed on recently dead or dying animals, especially cats that were hit or killed by cars or other means. The eaten remains may be found and suggest the animal was attacked by a coyote. In cases where Animal Services Officers respond to these calls, without knowledge of an actual attack, the incident will be recorded as a suspected attack.

**Sighting:** A visual observation of a coyote(s). A sighting may occur at any time of the day or night.

**Stalking:** A conflict between a human and a coyote where the coyote follows a person with or without an attended pet on leash. A human is not injured.

**Threat Incident:** A conflict between a human and a coyote where the coyote approaches a human and growls, bares teeth or lunges; injures or kills an attended domestic animal. A human is not injured.

**Unsecured Trash:** Trash that is accessible to wildlife, e.g. individual garbage cans, uncovered or open dumpsters or bags, or trash cans over flowing or where scattered trash is outside the receptacle.

<td>Never leave pets unattended outside.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Never allow pets to “play” with coyotes.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Fully enclose outdoor pet kennels.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Walk pets on a leash no longer than 6 feet in length.</td>
</tr>
</tbody>
</table>

We encourage residents to take steps to eliminate attractants on property to minimize conflicts with coyotes. We also recommend sharing this information with friends and neighbors because minimizing conflicts is most effective when the entire neighborhood works together.
